The act of gardening itself is a fantastic form of physical activity. It involves a range of motions, from digging and planting to watering and harvesting. These activities help improve strength, flexibility, and endurance. You might not realize it, but small tasks like weeding or turning compost can burn many calories. Gardening is particularly beneficial for those who find traditional exercise challenging. It's a low-impact way to stay active and fit, making it accessible for people of all ages and physical abilities. Besides physical health, gardening has profound mental health benefits. Tending to plants can be incredibly calming and meditative. It allows you to focus on the present moment, reducing stress and anxiety. The repetitive tasks involved in gardening can induce a state of mindfulness, similar to meditation. Studies have shown that spending time in nature, even in a small garden, can elevate mood, improve cognition, and reduce depression symptoms. The sense of accomplishment from watching your plants grow and thrive can also boost self-esteem and overall well-being.

[11~20] 다음 글을 읽고, 물음에 답하시오.

For many centuries, humans have taken advantage of tools that translate and bring into our perception natural phenomena that we can't perceive with our senses. In some cases, this consists of simply amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes to perceive on their own). Other instruments turn signals that we cannot perceive into ones that we can observe. Some of these take the form of expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally outside the range of what human ears can hear into audible signals. Alternatively, some instruments measure properties for which we have no sensory capacity at all and change them into that which we can observe.
